

220A lead-acid battery

With lead acid the higher the load, the more you need to increase the Ah capacity of your battery to help alleviate this. With Lithium however a load of even 10 times greater at 0.5C can still have a terminal voltage of 24V at 80% DOD/20% SOC, without going up on the Ah rating of the battery. This is what makes Lithium particularly suitable for high loads.

In a functional lead-acid battery, the ratio of acid to water should remain close to 35:65. You can use a hydrometer to analyze the precise ratio. In optimal conditions, a lead-acid battery should have anywhere between 4.8 M to 5.3 M sulfuric acid concentration for every liter of water. How do you properly refill a battery with acid? When refilling a battery with acid, it is ...
