How do I know if my car battery is broken?

If you want to know how to identify and fix a broken battery, here are some general guidelines. Give the battery a visual inspection to make sure there are no burn marks or signs of leaking fluid. Use a multimeter to check the voltage of the battery to make sure it's within the expected range of the battery.

How do you know if a battery is bad?

Another thing you can do is feel the battery to see if any particular spot is producing more heat than other areas of the battery pack. If after doing those things you feel like your battery might be bad, then you will have to tear it down enough to be able to measure the voltage of each cell group.

Is a small dent in a battery pack a problem?

That small dent in your battery pack could be a big problem. What may seem like a superficial blemish on the outside could be a serious problem inside the cell. If a cell is dented enough (it doesn't take much) the positive and negative sides of the cell will connect. This is not always as obvious as you may think.

What happens if a battery pack dents & Dings?

The overwhelming majority of dents and dings in a battery pack will only cause a minor short inside. The problem is that this minor short will manifest itself as a high level of self-discharge in that cell. That, of course, will throw the entire battery pack off balance. Exposure To High Temperatures

What happens if a battery fails a test?

Also, feel the battery during normal operation to make sure there are no hotspots. If the battery you are inspecting fails any of those tests, you will have to disassemble the battery down to the cell groups so that you can find out which cell group's voltage is out of spec.
